The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/549,590

Applicant(s)

SATO ET AL.

Examiner

CARALYNNE HELM

Art Unit

1615

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 12 November 2009.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,3,5,6,11,12,14-16 and 18 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,3,5,6,11,12,14-16 and 18 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

NEW REJECTIONS

Claim Objections

Claim 14 is objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim. Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form. This claim recites that the monomer having a nitrogen atom in its side chain is (meth)acrylamide; however its parent claim already includes this recitation.

MAINTAINED REJECTIONS

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.

4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

The four factual inquires of *Graham v. John Deere Co.* have been fully considered and analyzed in the rejections that follow.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 3, 5, and 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Uno et al. (previously cited) in view of Aiache et al. (previously cited), Nishihara et al. (previously cited), Yasuda et al. (previously cited), Janda et al. (previously cited), and Ohmura et al. (previously cited).

Uno et al. teach a contact lens with a polymer consisting of a 2-hydroxyethyl methacrylate (HEMA - hydrophilic monomer having a hydroxyl group in its molecule), 2-hydroxy-3-methacryloyloxypropyl triammonium chloride (MAPTAC - monomers having a nitrogen atom in its side chain), mono-(2-acryloyloxyethyl) acid phosphate (MOAP), triethylene glycol dimethacrylate (monomer copolymerizable with the other monomers) (see paragraph 19 and table 1 example 6; instant claim 1). The MAPTAC is taught

Art Unit: 1615

present at 5%, while the MOAP is present at 10 wt% (see table 1 example 6; instant claim 3). In addition, Uno et al. teach that mono-(2-acryloyloxyethyl) acid phosphate and 2-methacryloyloxyethyl acid phosphate (MOEP - Formula I/II) are functional equivalents (see paragraph 12; instant claim 1). Uno et al. do not explicitly teach that the resulting lens also contains a cationic group containing drug, the presence of a monomer of formula III along with the MOEP or (meth)acrylamide as a monomer with a nitrogen atom in its side chain.

Aiache et al. teach the inclusion of several types of drugs in a polyHEMA hydrogel contact lens (see column 13 lines 29-35). Nishihara et al. teach a variety of drugs that are commonly used in ophthalmic compositions (see paragraph 121). In this set is included several cationic compounds including ephedrine hydrochloride, tetrahydrozoline hydrochloride, and naphazoline sulfate which also each include a secondary amine (see paragraph 122; instant claims 1 and 5).

Yasuda et al. teach molded articles composed of polymers made from hydrophilic monomers (see abstract). Both ophthalmic (contact) lenses and dental materials are contemplated as the end uses for these materials (see column 6 lines 31-34). Yasuda et al. go on to teach particular monomers that are contemplated for use individually or in combination that include HEMA, 2-methacryloyloxyethyl dihydrogen phosphate (MOEP-formula II) and bis(2-methacryloyloxyethyl) hydrogen phosphate (formula III) (see column 8 lines 17-19, 24-27, and 43-45). Janda et al. teach the use of both MOEP and bis-(methacryloyloxyethyl) hydrogen phosphate (formula III) in a polymeric preparation for biological use (dental adhesive) (see example and claim 1;

instant claim 1). The proportion of the formula II in the formula II and formula III monomers is 50 wt% (see column 3 lines 1-15).

Ohmura et al. teach a hydrophilic copolymer preparation where a set of vinyl monomers that are radically polymerizable is one of its monomers (see column 11 lines 51-54). In this set, MAPTAC, meth(acrylamide) and quaternary ammonium salts of methacrylic acid are taught to be functionally equivalent (see column 11 lines 63-64 and column 11 lines 67-column 12 line 37; instant claims 4 and 14).

Since Uno et al. teach the equivalence of their phosphate containing monomers it would have been obvious to use MOEP in their exemplified composition instead of MOAP. In light of the teachings of Yasuda et al. and Janda et al. where the same combination of phosphate bearing, HEMA based hydrophilic monomers (where both MOEP and formula III are taught) can be used together in contact lenses or dental materials, it also would have been obvious to use bis(2-methacryloyloxyethyl) hydrogen phosphate along with MOEP in the composition of Uno et al. as the phosphate bearing monomers. Since these monomers in Uno et al. serve the purpose of providing an anionic group containing monomer, it would have been obvious to use the pair at the proportion taught by Uno et al., namely 10 wt% (see paragraph 12; instant claim 16). The distinction between formula II and formula III is that formula III contains the repetition of the hydroxyethyl methacrylate moiety present in formula II only once. This difference in architecture would allow for the presence of phosphate groups within a contiguous polymer chain upon polymerization of formula III, as opposed to pendent from a polymer chain as polymerization of formula II yields. Although an equal

Art Unit: 1615

proportion of these two monomers is taught by Janda et al., one of ordinary skill would have found it obvious to alter their relative ratio to control the final produce architecture and arrangement of charged groups in the final product (see instant claim 16). In addition, since the inclusion of an ophthalmic drug in contact lens was known in the art, it also would have been obvious to include a cationic drug in the resulting ophthalmic lens. This combination then renders obvious a contact lens with a cationic drug, and a copolymer made of HEMA, MAPTAC, MOEP, bis(2-methacryloyloxyethyl) hydrogen phosphate, and triethylene glycol dimethacrylate (see instant claims 1 and 15). Uno et al. teach the presence of a quaternary ammonium salt that is radically polymerizable in the polymer (see paragraph 12). In the example discussed, MAPTAC serves this function in the polymer. Since, based on Ohmura et al. (meth)acrylamide can be used in the same role as the general class (quaternary ammonium salt that is radically polymerizable) for the preparation of hydrophilic polymers, it would have been obvious to one of ordinary skill in the art to employ (meth)acrylamide instead of MAPTAC in the contact lens preparation of Uno et al. in view of Aiache et al., Nishihara et al. Yasuda et al., and Janda et al. Thus claims 1, 3, 5, and 14-16 are obvious over Uno et al. in view of Aiache et al., Nishihara et al., Yasuda et al., Janda et al., and Ohmura et al.

Claims 1, 16, and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Uno et al. in view of Aiache et al., Nishihara et al., Yasuda et al., and Janda et al. as applied to claims 1, 3, 5, and 14-16 above, and further in view of Kamishita et al. (previously cited).

Uno et al. in view of Aiache et al., Nishihara et al., Yasuda et al., Janda et al. and Ohmura et al. make obvious a contact lens with a drug, and a copolymer made of HEMA, MAPTAC, MOEP, bis(2-methacryloyloxyethyl) hydrogen phosphate, and triethylene glycol dimethacrylate with the claimed proportions and ratios of monomers. Although the modified reference does teach other salt forms of naphazoline, it does not explicitly teach naphazoline nitrate specifically as the drug.

Kamishita et al. teach that naphazoline nitrate is a known drug that is used to treat ailments of the eye, (see column 3 lines 10-13; instant claim 18). Since this compound was known to be delivered to the eye and ophthalmic lens as the means of delivery were also known, it would have been obvious to one of ordinary skill in the art to employ naphazoline nitrate in an ophthalmic lens. In addition, since other salt forms were also known for delivery to the eye, one of ordinary skill in the art would have found it obvious to employ naphazoline nitrate as the cationic drug in Uno et al. in view of Aiache et al., Nishihara et al., Yasuda et al., and Janda et al. Thus claims 1, 16, and 18 are obvious over Uno et al. in view of Aiache et al., Nishihara et al., Yasuda et al., Janda et al., and Kamishita et al.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sulc et al. (previously cited) in view of Aiache et al. (previously cited).

Sulc et al. teach a contact lens (ophthalmic lens) as a drug delivery system where a cationic and anionic monomer pair is used (see column 5 lines 3-6; instant claim 6). Specifically Sulc et al. teach the lens made from a copolymer of N,N-

Art Unit: 1615

dimethylaminoethyl methacrylate (anionic monomer), methacrylic acid (cationic monomer), HEMA (hydrophilic monomer), and ethylene glycol dimethacrylate (monomer copolymerizable with the other monomers) (see column 2 lines 66-67, column 3 lines 3-6 and 58-61, column 4 lines 22-25, and example 1). Sulc et al. teach the anionic to cationic polymer ratio in one embodiment to be approximately 90 mol% (90.7 mol% as calculated by examiner from example 1). It would therefore have been obvious to one of ordinary skill in the art at the time of the invention to use the contact lens formulation of Sulc et al. with an anion-cationic monomer ratio of 90mol%. Sulc et al. do not teach particular drugs to use in the embodiment where the lens is also a drug delivery device.

Aiache et al. teach the inclusion of a sodium diclofenac, an anionic and carbonyl group containing drug, in a polyHEMA hydrogel contact lens (see example 7). Thus in view of the teachings of Aiache et al. it would have been obvious to one of ordinary skill in the art at the time of the invention to employ sodium diclofenac in the invention of Sulc et al. Thus claim 6 is obvious over Sulc et al. in view of Aiache et al.

Claims 6, 11, and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sulc et al. in view of Aiache et al. as applied to claim 6 above and in further view of Lee et al. (previously cited), Atkinson et al. (previously cited), and Kato et al. (previously cited).

Sulc et al. in view of Aiache et al. make obvious an anionic drug containing contact lens with a copolymer consisting of a hydrophilic monomer, cationic monomers, anionic monomers and a monomer copolymerizable with these components such that

the molar ratio of anionic monomer to cationic monomer is 30 to 90 mol%. Sulc et al. in view of Aiache et al. do not teach a water soluble azulene as one such anionic drug delivered from their device or explicitly teach a molar ratio of 40 mol% to 80 mol%.

Lee et al. teach that an anionic molecule contained within a cationic hydrogel is released slowly due to the electrostatic interaction between the opposite charges (see figure 3). Atkinson teaches that the presence of both cationic and anionic monomers in a hydrogel adds to its mechanical integrity via their ionic interaction (see page 7 lines 6-13 and tables 1 and 2). Thus the manipulation of the proportion of anionic to cationic monomer in the invention Sulc et al. would have been obvious to one of ordinary skill in the art to facilitate multiple results. The first result would be to allow for added mechanical integrity of the lens. Secondly, the amount of excess cationic charge controls the amount of anionic drug that can be retained long term (e.g. based on duration of dosing regimen or use) and slowly released from the lens. Such a parameter (result effective variable) would be obvious to optimize during the course or routine experimentation and based upon the desired end use (see instant claim 11).

Kato et al. teach that sodium azulene sulfonate (water soluble azulene) is a known drug that is used to treat ailments of the eye, such as inflammation (see column 2 lines 7-14; instant claim 12). Although Kato et al. teach this compound being delivered via eye drops, it would have been obvious to one of ordinary skill in the art at the time of the invention to use another known means of delivery, such as in a contact lens as taught by Aiache et al. and Sulc et al. Therefore it would have been obvious to use sodium azulene sulfonate instead of the particular drugs taught by Aiache et al. in the

Art Unit: 1615

device of Sulc et al. Thus claims 6, 11, and 12 are obvious over Sulc et al. in view of Aiache et al., Lee et al., Atkinson et al., and Kato et al.

Response to Arguments

Applicants' arguments, filed November 12, 2009, have been fully considered but are not persuasive.

Regarding rejections under 35 USC 103(a):

Applicants argue that the number of references cited coupled with the absence of "an extraordinary number of elements" demonstrates the non-obviousness of the instant invention. One of ordinary skill in the art is certainly capable of assimilating the information from more than two references in the pursuit of a device prepared from a multiplicity of monomer units to generate a polymer that is then formed into a medical device. Furthermore, reliance on a large number of references in a rejection does not, without more, weigh against the obviousness of the claimed invention. See *In re Gorman*, 933 F.2d 982, 18 USPQ2d 1885 (Fed. Cir. 1991).

Applicants additionally argue that Uno et al. and Ohmura et al. do not teach the incorporation of a nitrogen containing monomer for the reasons put forth by the instant application. The reason or motivation to modify the reference may often suggest what the inventor has done, but for a different purpose or to solve a different problem. "It is not necessary that the prior art suggest the combination to achieve the same advantage

or result discovered by applicant. See, e.g., *In re Kahn*, 441 F.3d 977, 987, 78 USPQ2d 1329, 1336 (Fed. Cir. 2006)” (see MPEP 2144 IV).

Applicants argue that there was no teaching provided by Ohmura et al. or any of the other references to select a monomer with a nitrogen atom in its side chain. This argument is not found to be persuasive because Uno et al. explicitly teach the inclusion of such a monomer in general. Further, Ohmura et al. teach a set of monomers where both the nitrogen containing monomer envisioned by Uno et al. is taught as well as a variety of other such monomers that include (meth)acrylamide. Thus the combined references suggest the selection of a monomer with a nitrogen atom in its side chain as well as makes obvious the selection of (meth)acrylamide as one such monomer.

Applicants go on to argue that the teachings of Sulc et al. of a substantially equimolar amount of cationic and anionic vinyl monomers would not render obvious the instantly claimed molar ratios. Applicants go further to inject the limitation in Sulc et al. that “substantially” only permits a 10% deviation from unity. Sulc et al. does not apply such a definitive boundary on the term “substantially” and clearly envision deviation from a strictly equimolar amount of cationic and anionic vinyl monomers as demonstrated by their examples. In light of this, one of ordinary skill in the art would have had good reason to use routine experimentation in the invention of Sulc et al. Furthermore, the substantially equimolar ratio of monomers could reasonably include 80 mol% and 90 mol%. Applicants have not demonstrated that either of these ratios would yield an inoperative invention as far as Sulc et al. is concerned nor has the criticality of

the claimed range been demonstrated such that an unexpected result is obtained when the claimed range is utilized that is not obtained outside the range.

Finally, applicants argue that the teachings of Kato et al. of the application of a liposome vehicle for the delivery of a drug to the eye is unrelated to the art of Sulc et al. and Aiache et al. Kato et al. is relevant to the teaching to Sulc et al. because they also teach a vehicle for the administration of drugs to the eye. In this capacity the references are related. Sulc et al. does not teach particular drugs that are to be delivered from their contact lenses; however, Kato et al. teach particular drugs that were known to be delivered to the eye. One of ordinary skill in the art would have found it obvious to include any drug known for delivery to the eye, thus the teachings of Kato et al. would have been a reasonable source for such a teaching.

Rejections and/or objections not reiterated from previous office actions are hereby withdrawn. The rejections and/or objections detailed above are either reiterated or newly applied. They constitute the complete set presently being applied to the instant application.

Conclusion

No claim is allowed.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CARALYNNE HELM whose telephone number is (571)270-3506. The examiner can normally be reached on Monday through Friday 9-5 (EDT).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Robert A. Wax can be reached on 571-272-0623. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
